

2022 CURES DISCLOSURES

Multi-Factor Authentication

Protecting Patient health information is of critical importance to practices. To ensure that each practice's information is as secure as possible the Criteriaions EHR 4 offers Multi-Factor Authentication (MFA) through SMS and/or email based on a practice's configuration. When activated, MFA requires the entry of a unique one-time password (OTP) sent via SMS/email to validate the unique user after entry of username and password. Any user who cannot supply the MFA OTP code will be denied entry to the system in its entirety. Upon login, the Criteriaions EHR requires additional MFA compliance for the transmission of Electronically Prescribed Controlled Substances (EPCS). This additional layer of security ensures that controlled medications are not transmitted without MFA of the submitting physician. Criteriaions Portal applications support MFA through SMS and/or email OTP.

EHI

The Criteriaions EHR allows customers to export industry-standard patient information in XML format using CCDa architecture and our Email/Print Chart functionality. Exports can be performed without intervention from programming or Criteriaions Software, Inc and without charge for individual patients, groups of patients, or automated scheduled export. Regular updates are performed in compliance with standards as found at <https://www.hl7.org/implement/standards/>.
