Preliminary considerations

About this guide

Read this guide if you requested patient data from a practice that uses Veradigm ePrescribe™, and the practice fulfilled your request with files generated from the Health Information Export tool. This guide gives you information for integrating the data into your organization's software.

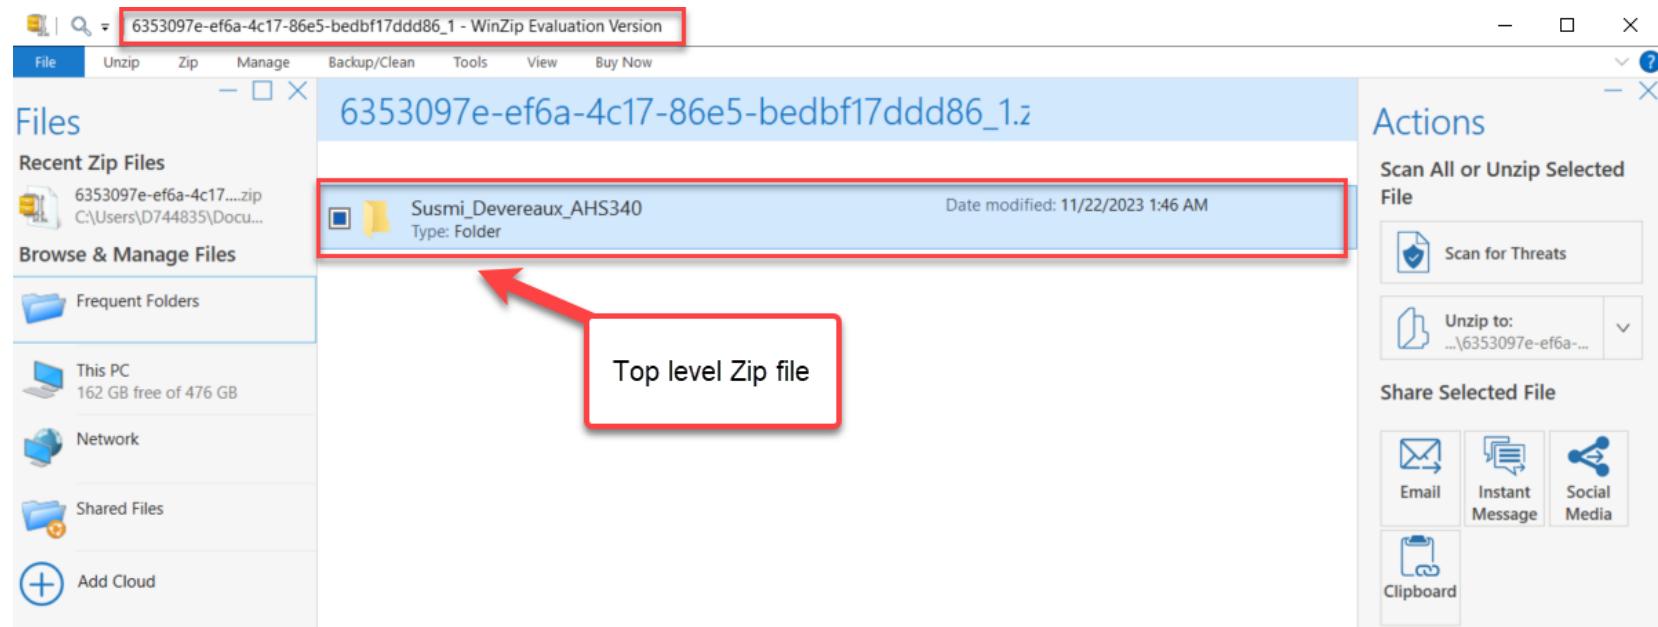

Extracting from the .zip files

Because the Veradigm ePrescribe Health Information Export tool packages data in .zip files, you probably received at least one .zip file from the practice.

To unzip the file, use a third-party file archiver program such as WinZip, WinRAR, or 7zip. The file extraction feature in Microsoft® Windows® Explorer can unzip the file.

The file contents are one or more folders, each of which corresponds with a single patient chart. In the following example, the top-level .zip file from Practice ABC contains one folder for one patient which contains 7 files; each folder is named with a combination of the patient's First name, last name and internal ID.

Figure 1: Example patient .zip files (viewed in archiver program WinZip)

Note: The example above displays patient .zip files in a window of the WinZip program. If you use a different archiver program, the .zip file icons will be different, and the options for extracting and working with files will be different.

Figure 2: .tsv files in Patient folder

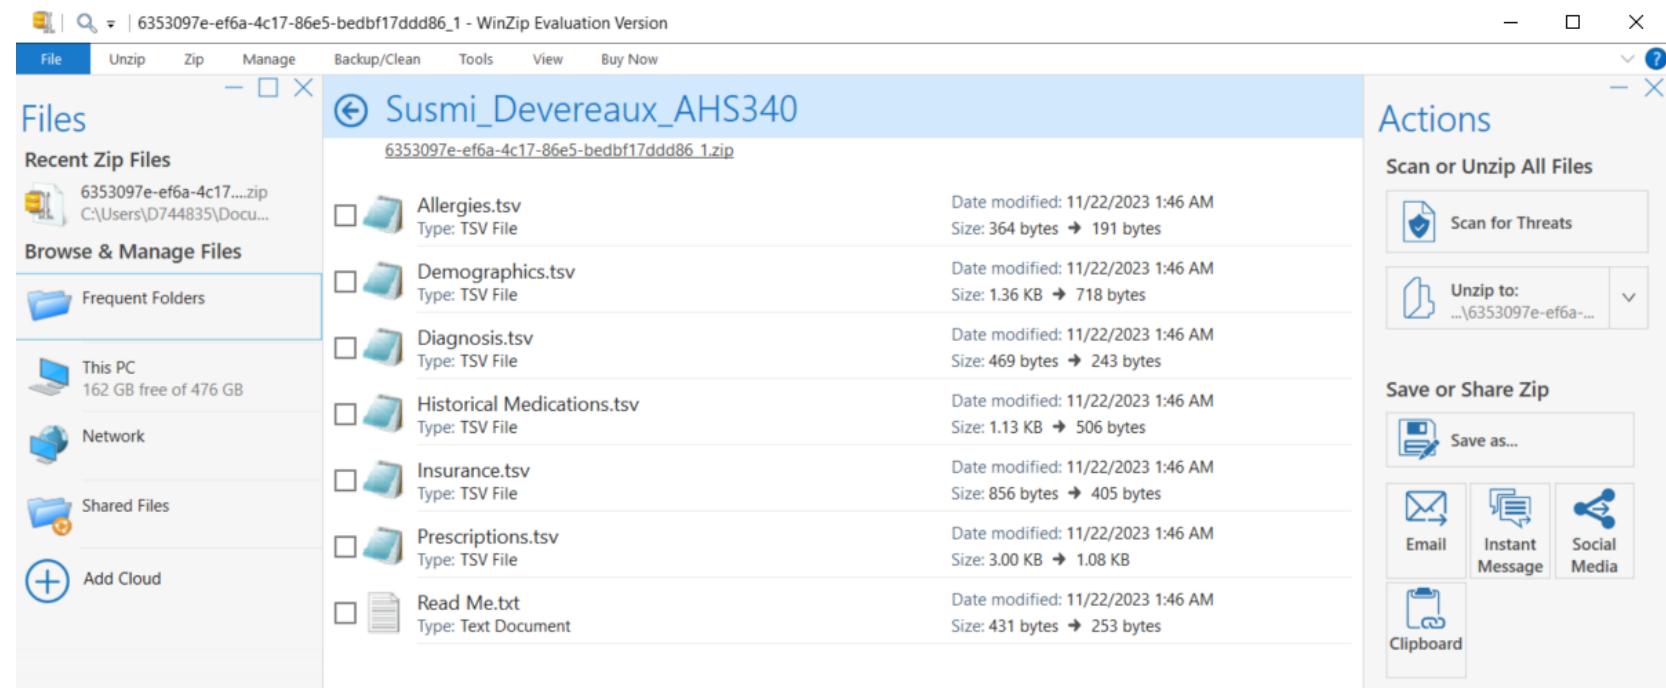

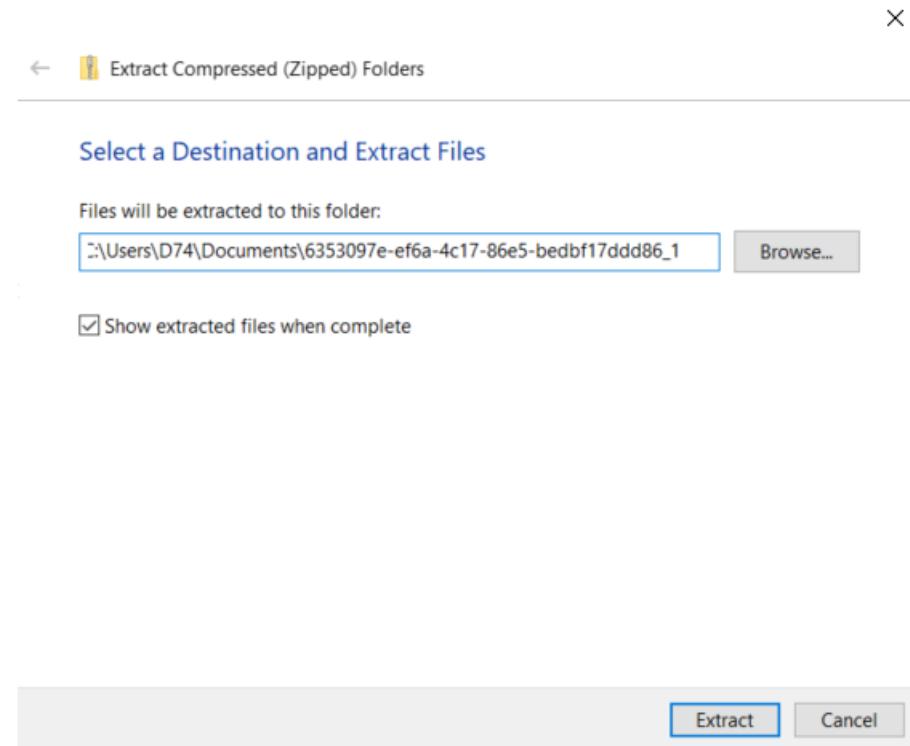

Figure 3: .Zip files extraction using Windows® Explorer

Contents of a patient folder

Chart extracts

The top level folder can contain one or more patient folder depending on data requested. If a provider has selected individual patient at the time of data extract, single folder exists. If the provider has selected multiple patients at time of data extract, multiple folders exist with title as first name, last name and internal ID.

In a patient folder, there are 7 files in following order:

- Allergies.tsv
- Demographics.tsv
- Diagnosis.tsv
- Historical Medications.tsv
- Insurance.tsv
- Prescriptions.tsv
- Read Me.txt

About the *.tsv* file format

The EHI Tables export contains the electronic health information available in a patient's Veradigm ePrescribe record in a computable, tab-separated value (TSV) file format native to Veradigm ePrescribe. TSV files are best viewed when imported into a Microsoft® Excel® book.

Tables of field definitions

The next portion of this document is divided into sections that correspond with the clinical domain files nested under the top-level folder.

Discrete Data files.

Each section contains a table for every TSV file of discrete data that falls into the applicable clinical domain. The tables define the fields used in the TSV files. And, because the fields are taken directly from the EHR database, the name of the corresponding EHR database table is also listed (along with its primary key).

Note: Among the TSV files that you receive for a patient, some might be empty. An empty TSV file indicates that no data exists for the patient in the corresponding EHR database table.
